Yeshwantrao Chavan College of Engineering

(An Autonomous Institution Affiliated to Rashtrasant Tukadoji Maharaj Nagpur University)

Hingna Road, Wanadongari, Nagpur-441110

NAAC Accredited with 'A^{***}' Grade

Ph. : 07104-295083, 295085

Website : www.ycce.edu, Email : principal@ycce.edu.

Summary of 4.2.2

Institution has access to the following :-

1. e-journals
2. e-books
3. N-List
4. Databases
5. Remote access to e-resources

1	Environmental Engineering for Civil Engineers	Tanjina Nur	Baker & Taylor Publisher Services (BTPS)	2020	TECHNOLOGY & ENGINEERING / Civil / General	Sustainable engineering.	9781774078150
2	Environmental Engineering and Disaster Management	Gaur, R.C.	New Age International	2019	TECHNOLOGY & ENGINEERING / Environmental / General	Disasters.,Emergency management.,Environm	9788122451054
3	Basic Civil Engineering	Bhavikatti, S.S.	New Age International	2019	TECHNOLOGY & ENGINEERING / Civil / General	Civil engineering--Textbooks.	9788122458176
4	Concepts in Engineering Design	Aziz, Atif	New Age International	2017	TECHNOLOGY & ENGINEERING / Engineering (General)	Engineering design.,Engineering.	9788122444902
5	Space Fault Tree Theory and System Reliability Analysis	Tiejun CUI-Shasha Li	EDP Sciences	2020	SCIENCE / System Theory	Reliability (Engineering)	9782759825042
6	Engineering Economy in Upstream Oil & Gas Field Development	Menglan DUAN-Mac Darlington	EDP Sciences	2020	BUSINESS & ECONOMICS / Industries / Energy	Gas fields--Economic aspects.,Oil fields--	9782759825011
7	Highway Engineering	A.M. Chandra	New Age International	2020	TECHNOLOGY & ENGINEERING /	Highway engineering.	978812245
8	Engineering Background Knowledge for Social Robots	L. Asprino	IOS Press	2020	COMPUTERS / Artificial Intelligence / General	Robots.,Semantic Web.	9781643681092
9	Soil and Rock Description in Engineering Practice 3rd Edition	Norbury, David	Whittles Publishing	2020	TECHNOLOGY & ENGINEERING / Civil / Soil & Rock	Civil engineering.,Rocks.,Soils.	9781849954839
10	Actual Problems of Engineering Mechanics: Materials Science and Technologies	Mykola Surianinov	Trans Tech Publications, Ltd	2020	SCIENCE / Mechanics / General	Mechanical engineering--Congresses.,Mechanics,	9783035738094
11	Mechanical Engineering: Advanced Materials Processing Technology	Suwarno-Vivien Djanali-Fahmi	Trans Tech Publications, Ltd	2020	MEDICAL / General	Materials science--Congresses.,Mechanical	9783035736878
12	Critical Issues and Analysis in Fire Protection and Prevention	Axel Cablé	Nova Science Publishers, Inc.	2020	SCIENCE / Environmental Science	Fire prevention.,Fire protection engineering.	9781536187960
13	Innovative Trends in Personalized Software Engineering and Information Systems	C. Troussas-C. Sgouropoulou	IOS Press	2020	COMPUTERS / Computer Science	Artificial intelligence--Educational	9781643680972
14	Waste Treatment Processes in Environmental Engineering in 4 Vols. (Set)	BN Rai-DR Saini-S N Kaul-Prateek	Astral International Private Limited	2018	SCIENCE / Life Sciences / Ecology	Environment engineering.,Environmen	9789386949585
15	Maximum Power Point Tracking: Background, Implementation and Classification	Maurice Hébert	Nova Science Publishers, Inc.	2020	TECHNOLOGY & ENGINEERING / Electrical	Electric current converters.,Maximum	9781536182798
16	Surface Subsidence Engineering	Syd Peng	CSIRO Publishing	2020	TECHNOLOGY & ENGINEERING / Mining	Mine subsidences.,Mining	9781486312559
17	Materials and Technologies in Precision Machinery III	Gow-Yi Tzou	Trans Tech Publications, Ltd	2020	SCIENCE / Mechanics / General	Industrial engineering--Congresses.,Machine-	9783035737776
18	Polymer Science and Engineering	Katsuyuki Kida	Trans Tech Publications, Ltd	2020	SCIENCE / Mechanics / General	Composite materials--Congresses.,Engineering	9783035736380
19	Utilization of Waste-Derived Fuels in the Carbonate Looping Process: Experimental	Haaf, Martin	Cuvillier Verlag	2020	TECHNOLOGY & ENGINEERING / Mechanical	Carbon dioxide mitigation.,Carbon	9783736962293

Keywords—Convolutional neural network algorithm, computer network topology, network characteristics

I. INTRODUCTION

The mode of computer network connection also refers to the computer network topology, which is the node formed between the computer and the network, as well as the formed line [1]. The nodes of the network are mainly composed of

interactivity of information, thereby expanding the topological structure of the computer network [5].

II. ALGORITHM PRINCIPLE OF CONVOLUTIONAL NEURAL NETWORK

The artificial neural network system is a pioneering work in the middle of the last century. It is widely used and has good parallel processing, distributed information storage, self-organizing and self-learning capabilities. Convolutional neural networks have been widely used in many fields, especially It is more concerned by researchers in the fields of information processing, pattern recognition, intelligent control, and system modeling [6]. The convolutional neural network algorithm is a supervised learning algorithm that uses learning samples to use backpropagation methods. The deviation of the network is adjusted repeatedly, so that the output structure and the expected vector are infinitely close [7].

The typical structure of convolutional neural network usually includes: input layer, convolution layer, down-sampling layer (also known as pooling layer), fully

III. OPTIMIZED COMPUTER NETWORK CONNECTION ENHANCEMENT ALGORITHM BASED ON CONVOLUTIONAL NEURAL NETWORK

A. Network model construction

The structure of the network model determines the data fitting ability and generalization performance of the network model. In actual applications, the structure definition of the network model needs to define the depth of the network according to the amount of training data and the characteristics of the data set itself. The hierarchical functions of the network, and the hyperparameters in the network. As a heuristic method, the standard of convolutional neural network structure definition mainly comes from some experience summaries. In the actual experiment process, it is usually necessary to debug the structure and hyperparameters of the network based on the training data set to obtain the best network performance [11].

The numerical characteristics of each network into the network model data set have different dimensions. The data of different dimensions will increase the training time of the convolutional neural network. Therefore, in order to speed up the convergence of the training convolutional neural network, this paper uses minimum-maximum normalization to linearly transform the original data, and map the data values to [0,1]. Assuming that the input numerical features remain unchanged, the formula is as shown in (1)

$$x_i = \frac{x_i - \min(X)}{\max(X) - \min(X)}$$

gradient explosion or disappearance, which makes deep learning models difficult to train. In order to solve the above problems, this part will introduce short-circuit jump links, and its structure is shown in Figure 2.

Fig.2 Short-circuit jump link structure diagram

Assuming that the computer network of the f-th layer of the neural network has undergone data preprocessing and data conversion, the feature map of the image is m , and then the features of the network convolutional neural network data are extracted through a layer of convolution operation. In order to prevent the gradient dispersion phenomenon generated by the neural network during the training process,

the topology of the network structure.

According to the current research situation, there are still many ways to enhance and optimize computer network connection efficiency and increase network communication capacity, but these methods and measures have more or less problems of this kind, or they are not practical. And the economy, and the enhanced and optimized computer network connection ground averaging neural network algorithm proposed in this paper can well meet the above requirements and has good economy [16].

By establishing a scientific and reasonable field average neural network model, it is helpful to carry out computer network connection enhancement and optimization in the field average neural network algorithm research work, and then judge the network effect. It should be noted that when using the function method to construct a model, we should strengthen the problem of constructing the objective function. Based on the enhanced optimization network connection average field neural network algorithm, in order to analyze this neural network algorithm in depth and achieve the desired result, the first step is to construct an excellent average field neural network model. The construction of the network algorithm model needs to pay attention to many factors, especially in the process of constructing and selecting the objective function to choose appropriate, scientific and effective. Based on the characteristics of computer networks, there are other different connection

CHAPTER

Introduction to Digital Control 1

OBJECTIVES

After completing this chapter, the reader will be able to do the following:

1. Explain the reasons for the popularity of digital control systems.
2. Draw a block diagram for digital control of a given analog control system.
3. Explain the structure and components of a typical digital control system.

In most modern engineering systems, it is necessary to control the evolution with time of one or more of the system variables. Controllers are required to ensure satisfactory transient and steady-state behavior for these engineering systems. To guarantee satisfactory performance in the presence of disturbances and model uncertainty, most controllers in use today employ some form of negative feedback. A sensor is needed to measure the controlled variable and compare its behavior to a reference signal. Control action is based on an error signal defined as the difference between the reference and the actual values.

The controller that manipulates the error signal to determine the desired control action has classically been an analog system, which includes electrical, fluid, pneumatic, or mechanical components. These systems all have *analog* inputs and outputs (i.e., their input and output signals are defined over a continuous time interval and have values that are defined over a continuous range of amplitudes). In the past few decades, analog controllers have often been replaced by *digital* controllers whose inputs and outputs are defined at discrete

emission from the publisher, except fair use permitted under U.S. or applicable copyright law.

2 CHAPTER 1 Introduction to Digital Control

1.1 Why digital control?

Digital control offers distinct advantages over analog control that explain its popularity. Here are some of its many advantages:

Accuracy. Digital signals are represented in terms of zeros and ones with typically 12 bits or more to represent a single number. This involves a very small error as compared to analog signals, where noise and power supply drift are always present.

Implementation errors. Digital processing of control signals involves addition and multiplication by stored numerical values. The errors that result from digital representation and arithmetic are negligible. By contrast, the processing of analog signals is performed using components such as resistors and capacitors with actual values that vary significantly from the nominal design values.

Flexibility. An analog controller is difficult to modify or redesign once implemented in hardware. A digital controller is implemented in firmware or software and its modification is possible without a complete replacement of the original controller. Furthermore, the structure of the digital controller need not follow one of the simple forms that are typically used in analog control. More complex controller structures involve a few extra arithmetic operations and are easily realizable.

Speed. The speed of computer hardware has increased exponentially since the 1980s. This increase in processing speed has made it possible to sample and process control signals at very high speeds. Because the interval between samples, the sampling period, can be made very small, digital controllers achieve performance that is essentially the same as that based on continuous monitoring of the controlled variable.

2. Obtain the z-transform of a given time sequence and the time sequence corresponding to a function of z.
3. Solve linear time-invariant (LTI) difference equations using the z-transform.
4. Obtain the z-transfer function of an LTI system.
5. Obtain the time response of an LTI system using its transfer function or impulse response sequence.
6. Obtain the modified z-transform for a sampled time function.
7. Select a suitable sampling period for a given LTI system based on its dynamics.

Digital control involves systems whose control is updated at discrete time instants. Discrete-time models provide mathematical relations between the system variables at these time instants. In this chapter, we develop the mathematical properties of discrete-time models that are used throughout the remainder of the text. For most readers, this material provides a concise review of material covered in basic courses on control and system theory. However, the material is self-contained, and familiarity with discrete-time systems is not required. We begin with an example that illustrates how discrete-time models arise from analog systems under digital control.

2.1 Analog systems with piecewise constant inputs

In most engineering applications, it is necessary to control a physical system or **plant** so that it behaves according to given design specifications. Typically, the plant is analog, the control is piecewise constant, and the control action is updated periodically. This arrangement results in an overall system that is conveniently described by a discrete-time model. We demonstrate this concept using a simple example.

Abstract. An efficient scheme of emotion recognition using EEG signals is an initiation to our quest for developing emotionally intelligent systems and devices, in order to enhance the performance quality of the same. Classification of emotions, both euphoric and negative, using stimulated EEG signals acquired from subjects whose different emotional states were elicited using audio-visual stimuli. The underlying strategy involved the extraction of Power spectral density(PSD) and empirical mode decomposition (EMD) features from the raw EEG data and their classification using linear discriminant analysis (LDA) and linear support vector machine (SVM) thereby classifying the emotions into their respective emotion classes: neutral, happy and sad, with an average classification accuracy of 76.46%, where the neutral state has been classified most efficiently, with an average classification accuracy of 80.86%. The classification accuracy increases with EMD features with reduction in time and computational complexity. LDA is found to perform better than LSVM with EMD features.

The Role of Empirical Mode Decomposition on Emotion Classification 57

emotions [13]. Gross and Levenson's study of emotion elicitation with movie clips showed that movie clips if well chosen keeping in mind the discreteness and intensity, of proper duration, then they can elicit the targeted discrete emotions. Keeping in mind these findings and the age group and cultural background of the subjects under study, after extensive search of movie clips four movie clips are selected for eliciting positive (or happy) and negative (or sad), two movie clips of each category. The subjects were subjected to different sessions, where each session consisted of a total of six trials, two for each emotion. Each trial consisted of a blank screen for 10 seconds, followed by a set of five soothing pictures of total 30 seconds duration. This was given to relax the subjects so that their neutral EEG could be detected. This followed by movie clippings to elicit the emotion. In the end of each experiment the subjects were asked to fill a self assessment form to verify their feelings about the emotions they experienced for each of the clips shown. During the course of the experiment, the EEG signals were recorded using the NEUROWIN EEG amplifier of Nasan medicals (Fig. 2) with a sampling rate of 250Hz from electrodes positioned at F3, F4, Fp1 and Fp2, since they lie over the frontal and pre-frontal lobe [12],[14].

To extract EEG signals free from these artifacts the raw signals were pre-processed in the MATLAB environment using an elliptical band pass filter of order 10 and bandwidth 4-32Hz. The bandwidth of the filter is chosen as mentioned above since the required frequency bands are theta (4-7Hz) and alpha (8-12Hz) that lie well within the chosen range.

between L and V_{ds} is given by the equation (5) for I_{ds} .

$$I_{ds} = 1/2 \mu_n C_{ox} (W/L) (V_{gs} - V_{th})^2 (1 + \lambda V_{ds}) \quad (5)$$

Where,

- λ is the channel length modulation co-efficient (For longer channel lengths i.e. above $1\mu m$, λ is negligible).
- W/L is the width to length ratio of MOS device
- V_{gs} = Gate to Source voltage
- μ_n = Mobility of electrons
- C_{ox} = Oxide capacitance

Threshold voltage has been found to vary both with respect to channel length and width [7]. Fig.8 shows decrease of threshold voltage as the transistor size or L is increased for particular technology node. Width of the device is kept as 2μ .

5 Conclusion

In this paper an effort has been made to present the impact of short channel effects on threshold variation and leakage current at deep sub micron levels. Here we have studied the behaviour of SCE for 180nm and 45 nm NMOS transistors and compared them. Apart from sub threshold current there are other leakage currents which still dominate the chips at smaller nodes giving rise to a need of fundamental change of transistor structure. Further threshold drop due to increase in V_{DD} and transistor resizing again is a major concern for unpredictable leakages that may occur. This requires new low power circuit design techniques to nullify or minimise the SCE for
